

Prione

Is it necessary that we must focus our attention again? [BDH](#)

„Prione machen nicht immer krank. Prione können auch z.B. spezielle Fähigkeiten und Eigenschaften unter gesunden Wirten weiter vererben.

Prions may not be universally pathogenic and may even act as protein-based elements of inheritance in healthy organisms”. Halfmann R

“First, we successfully propagated various Creutzfeldt-Jakob disease isolates (sporadic, variant and iatrogenic CJD) in neuronal cultures expressing the human prion protein. Then, we found that doxycycline was the most effective compound, with important variations between isolates. Isolates from sporadic CJD, the most common form of prion diseases showed the highest sensitivity.”

““Amyloid” is a generic term and all amyloids, irrespective of amino acid sequence, are formed in a seeded nucleation mechanism in which a small aggregate (oligomers) of a few amyloid moieties (a seed or a nucleus) seed (nucleate) normal amyloid precursor moieties to change conformation to a β -sheet. ... There are several protein misfolding disorders - the most widely known include Alzheimer's disease, Parkinson's disease and other α -synucleinopathies, amyotrophic lateral sclerosis (ALS), frontotemporal dementias in which abnormally phosphorylated MAP- τ protein accumulates and finally, polyglutamine expansion diseases such as Huntington's disease and certain spinocerebellar ataxias. The proteins involved differ in each of these disorders but the molecular mechanism is almost exactly the same, a seeding-nucleation mechanism.”
