

## Symbiogenese, symbiogenesis

**Symbiogenese bzw. Symbiogenesis ist die Verschmelzung von zwei oder mehreren verschiedenen Organismen in einem einzigen neuen Organismus.**

**Symbiogenesis is a merger of two or more different organisms in a single new organism.**

**Ektosymbiose, ectosymbiosis: Die Partner sind getrennt. The partners are separated.**

**Endosymbiose, endosymbiosis: Einer der Partner wurde in den Körper des anderen aufgenommen. One of the partners was taken into the body of the other.**

**Correspondingly: ATTRAKTOREN; "Inseln der Ruhe", ATTRACTORS; "Islands of tranquility"**

“... **Borrelia are highly motile bacterial cells, and light microscopy shows that these spirochetes can associate with each other during movement. Using cryo-electron tomography, we observed closely associated Borrelia cells. Some of these showed a single outer membrane surrounding two longitudinally arranged cytoplasmic cylinders. We also observed fusion of two cytoplasmic cylinders and differences in the surface layer density of fused spirochetes. These processes could play a role in the interaction of Borrelia species with the host's immune system**”.
